Should we frame
educational experience
as
experiential learning?

“The study reveals that **individuals roam freely, rapidly, and extensively** across learning style categories.

Thus, the categorical differences measured by the KLSI **lack meaningful purpose.**

Whether or not learning styles are a neuromyth, this study indicates that the act of learning, as an act of agency, is **fluid with potentiality and choice.**

- Newton & Wang 2021”

How relevant is the aspect of "concreteness"?

Whose "concreteness" is it?

Online *complements*; does not replace in-person

Repartition to make best use of each mode

For both: adopt *critical post-humanist* approach
mixing both humanity & technology to achieve

- a sum greater than the parts,
- not bound by the limits of either

bit.ly/tdd135

We're not using technology,

we're *collaborating* with it:

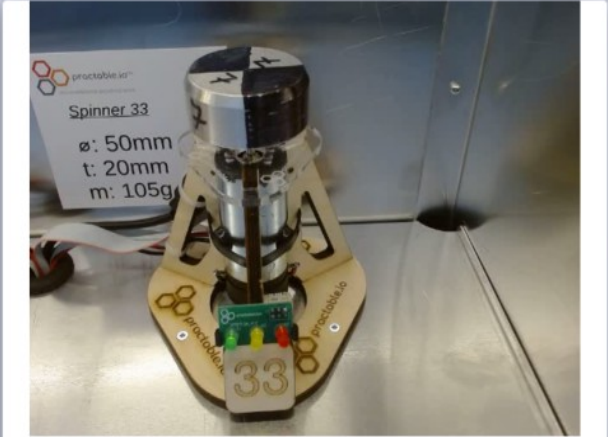

co-development with pedagogy becomes natural

2022

2021 Controls class

- 250 students
- 12 remote lab boxes
- Accessible 24 hrs/day for ~3 months
- Range of disk inertias

- N=21 responses → selection bias
- Mixed methods approach

User Experience

- Range usually +/-2 (max +/-3), >0.8 considered a significant positive result.

1.13

Attractiveness

Overall impression of the product. Do users like or dislike it?

1.51

Perspicuity

Is it easy to get familiar with the product and to learn how to use it?

1.08

Efficiency

Can users solve their tasks without unnecessary effort? Does it react fast?

Dependability

Does the user feel in control of the interaction? Is it secure and predictable?

0.76*

*1.06 if outliers removed

Stimulation

Is it exciting and motivating to use the product? Is it fun to use?

0.88

Novelty

Is the design of the product creative? Does it catch the interest of users?

1.17

User Experience

1.13

Attractiveness

I enjoyed the remote lab practical work
I am satisfied that I learned what I should have

1.51

Perspicuity

It was easy to navigate the user interface

1.08

Efficiency

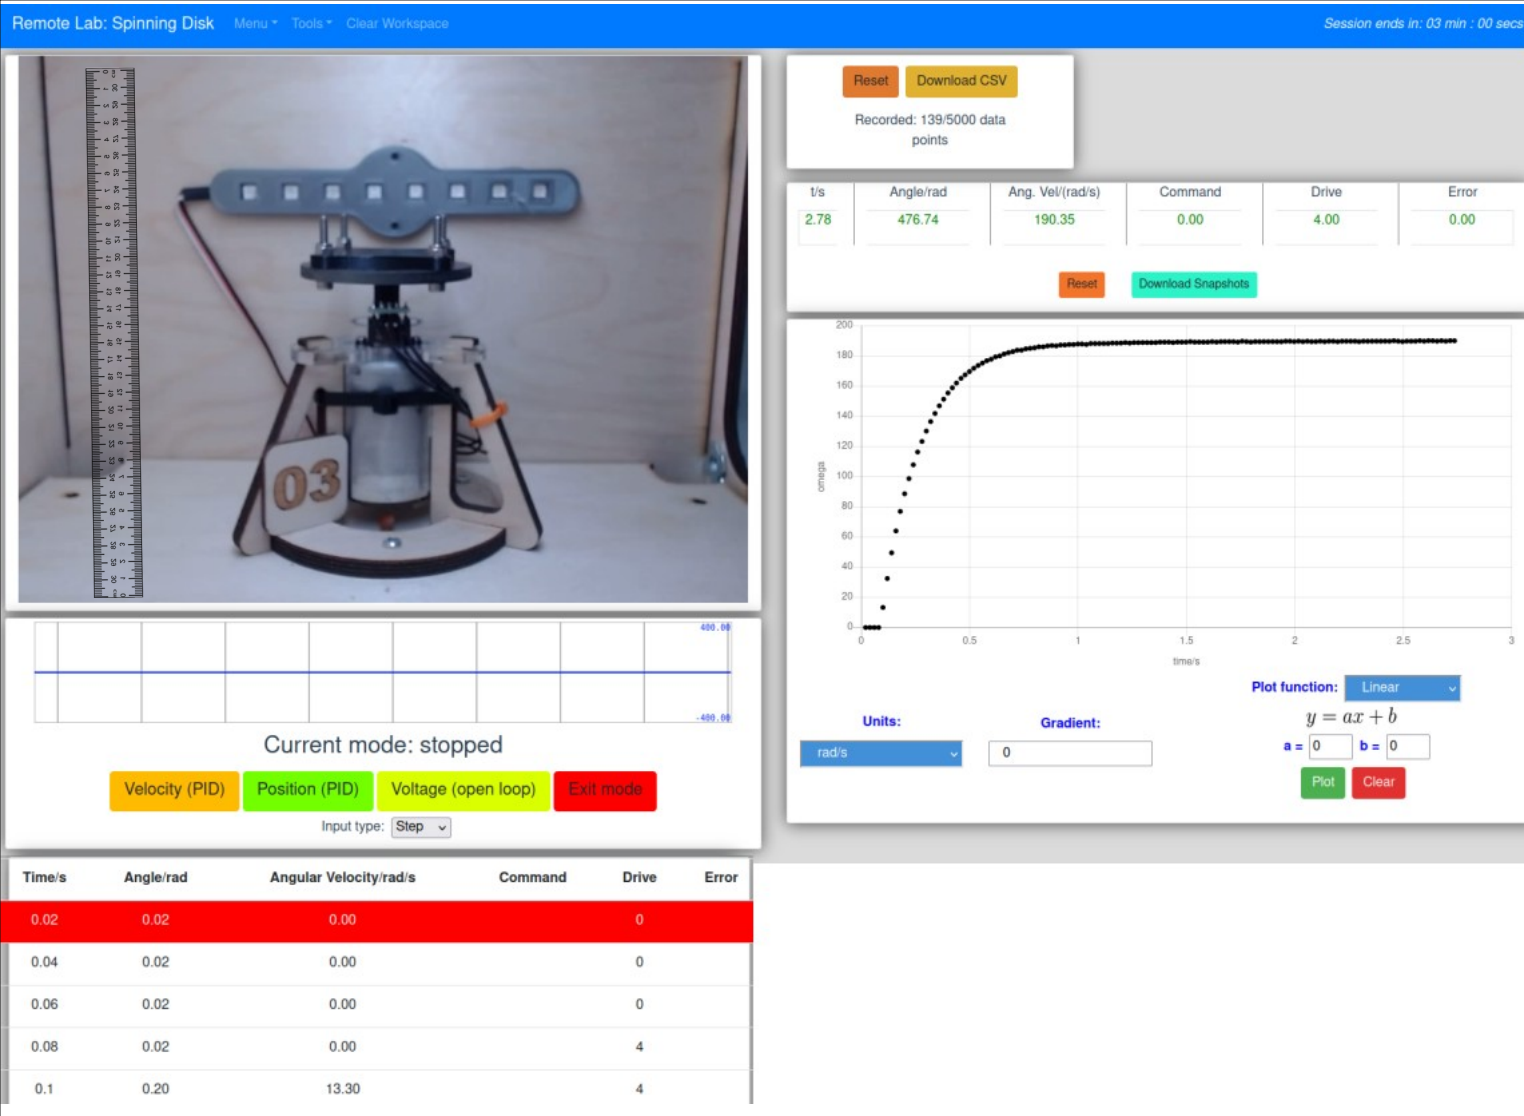

It was easy to collect the appropriate data
I believe the results of my experiment are accurate

0.76*

Dependability

I felt like I was in control of the hardware

UI ratings

UI Component	Rating		
	Easy to use	Useful	Feel in control

Measuring tools			

Positive rating, large effect size

Positive rating, medium effect size

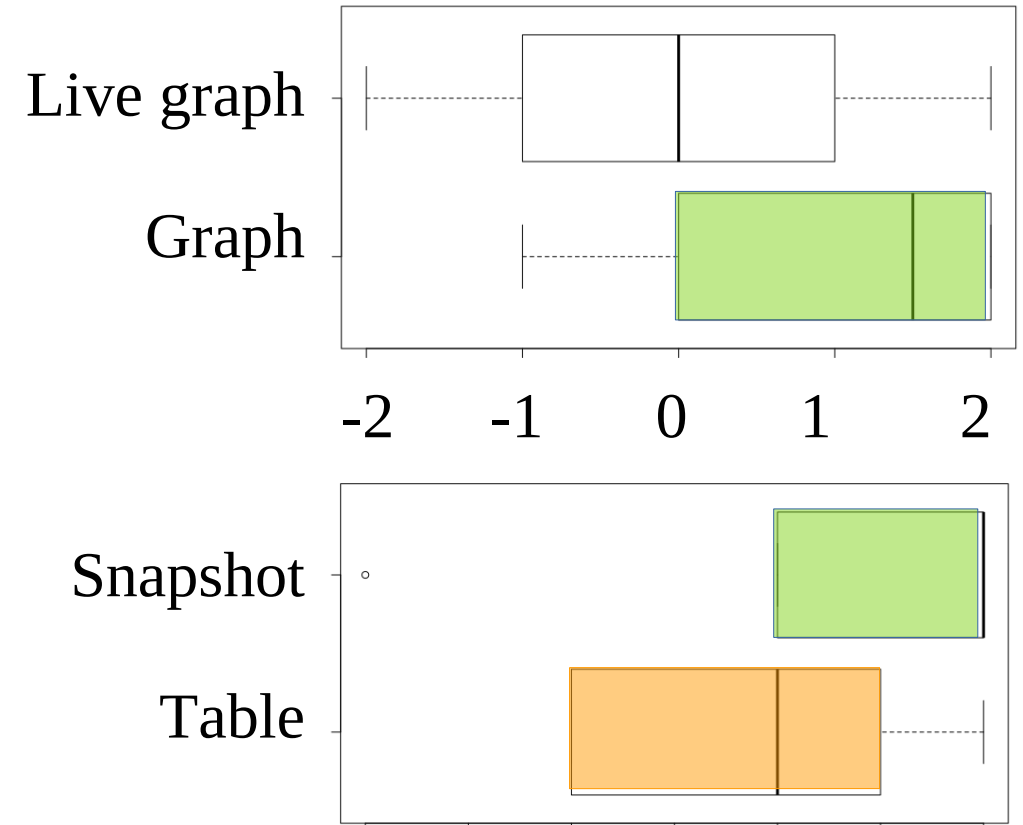

Not statistically different from neutral response

'Feeling in control'

'I am satisfied I learned the content' \propto 'I felt in control of the hardware'

Whose "concreteness" is it?

On experimental results vs textbook

- No correlation between 'user experience' and belief in cause of data discrepancies
- Tech/design issues do **not** strongly impact student trust in remote lab.
- Neutral response to statement: *'Remote labs are not real practical work'*

How relevant is the aspect of "concreteness"?

Perception of skills practice

Easier with REMOTE

Collecting data

Managing lab time

Comparing to theoretical models

Setting up equipment

Presenting data

Working safely

No significant difference

Analysing data

Investigating unknown quantities

Exploring beyond the lab book

Measuring accurately

Controlling variables

Easier with PROXIMAL

Designing my own experiment

Working with others

Using multiple senses

Q25. Any other thoughts or feelings?

Both theory not completely representative and errors in remote lab were reason results not completely match theory

Although not required, it would have been nice to **tell us about the other details of the system** too, like the motor and driver used.

The lab was impressively reliable and worked well. However I feel at least one in-person session would have aided understanding.

It seemed that **recorded data changed slightly the longer a disk was in use**. This may be due to increased temperature. I was not sure how to deal with this, so I did not use data obtained when disk temperature was high.

Would be nice if there were **more spinners available** to be used and if you could **cancel your time slot** when you were finished to allow others to be able to use the lab. Could also work better if spinner weights had been assigned to us to **evenly distribute** the number of students allocated to a spinner.

Remote allows for convenience and redoing of experiments if your data is out of range of expected values.

Physical allows more discussion between students on what is happening and why. Getting others views helps expand your own

It is a great tool, and made me feel more motivated than a purely simulated one would have. I would be happy to have it as an option in other courses alongside the physical lab, so that I don't always have to travel for a quick measurement.

Whose “concreteness” is it?

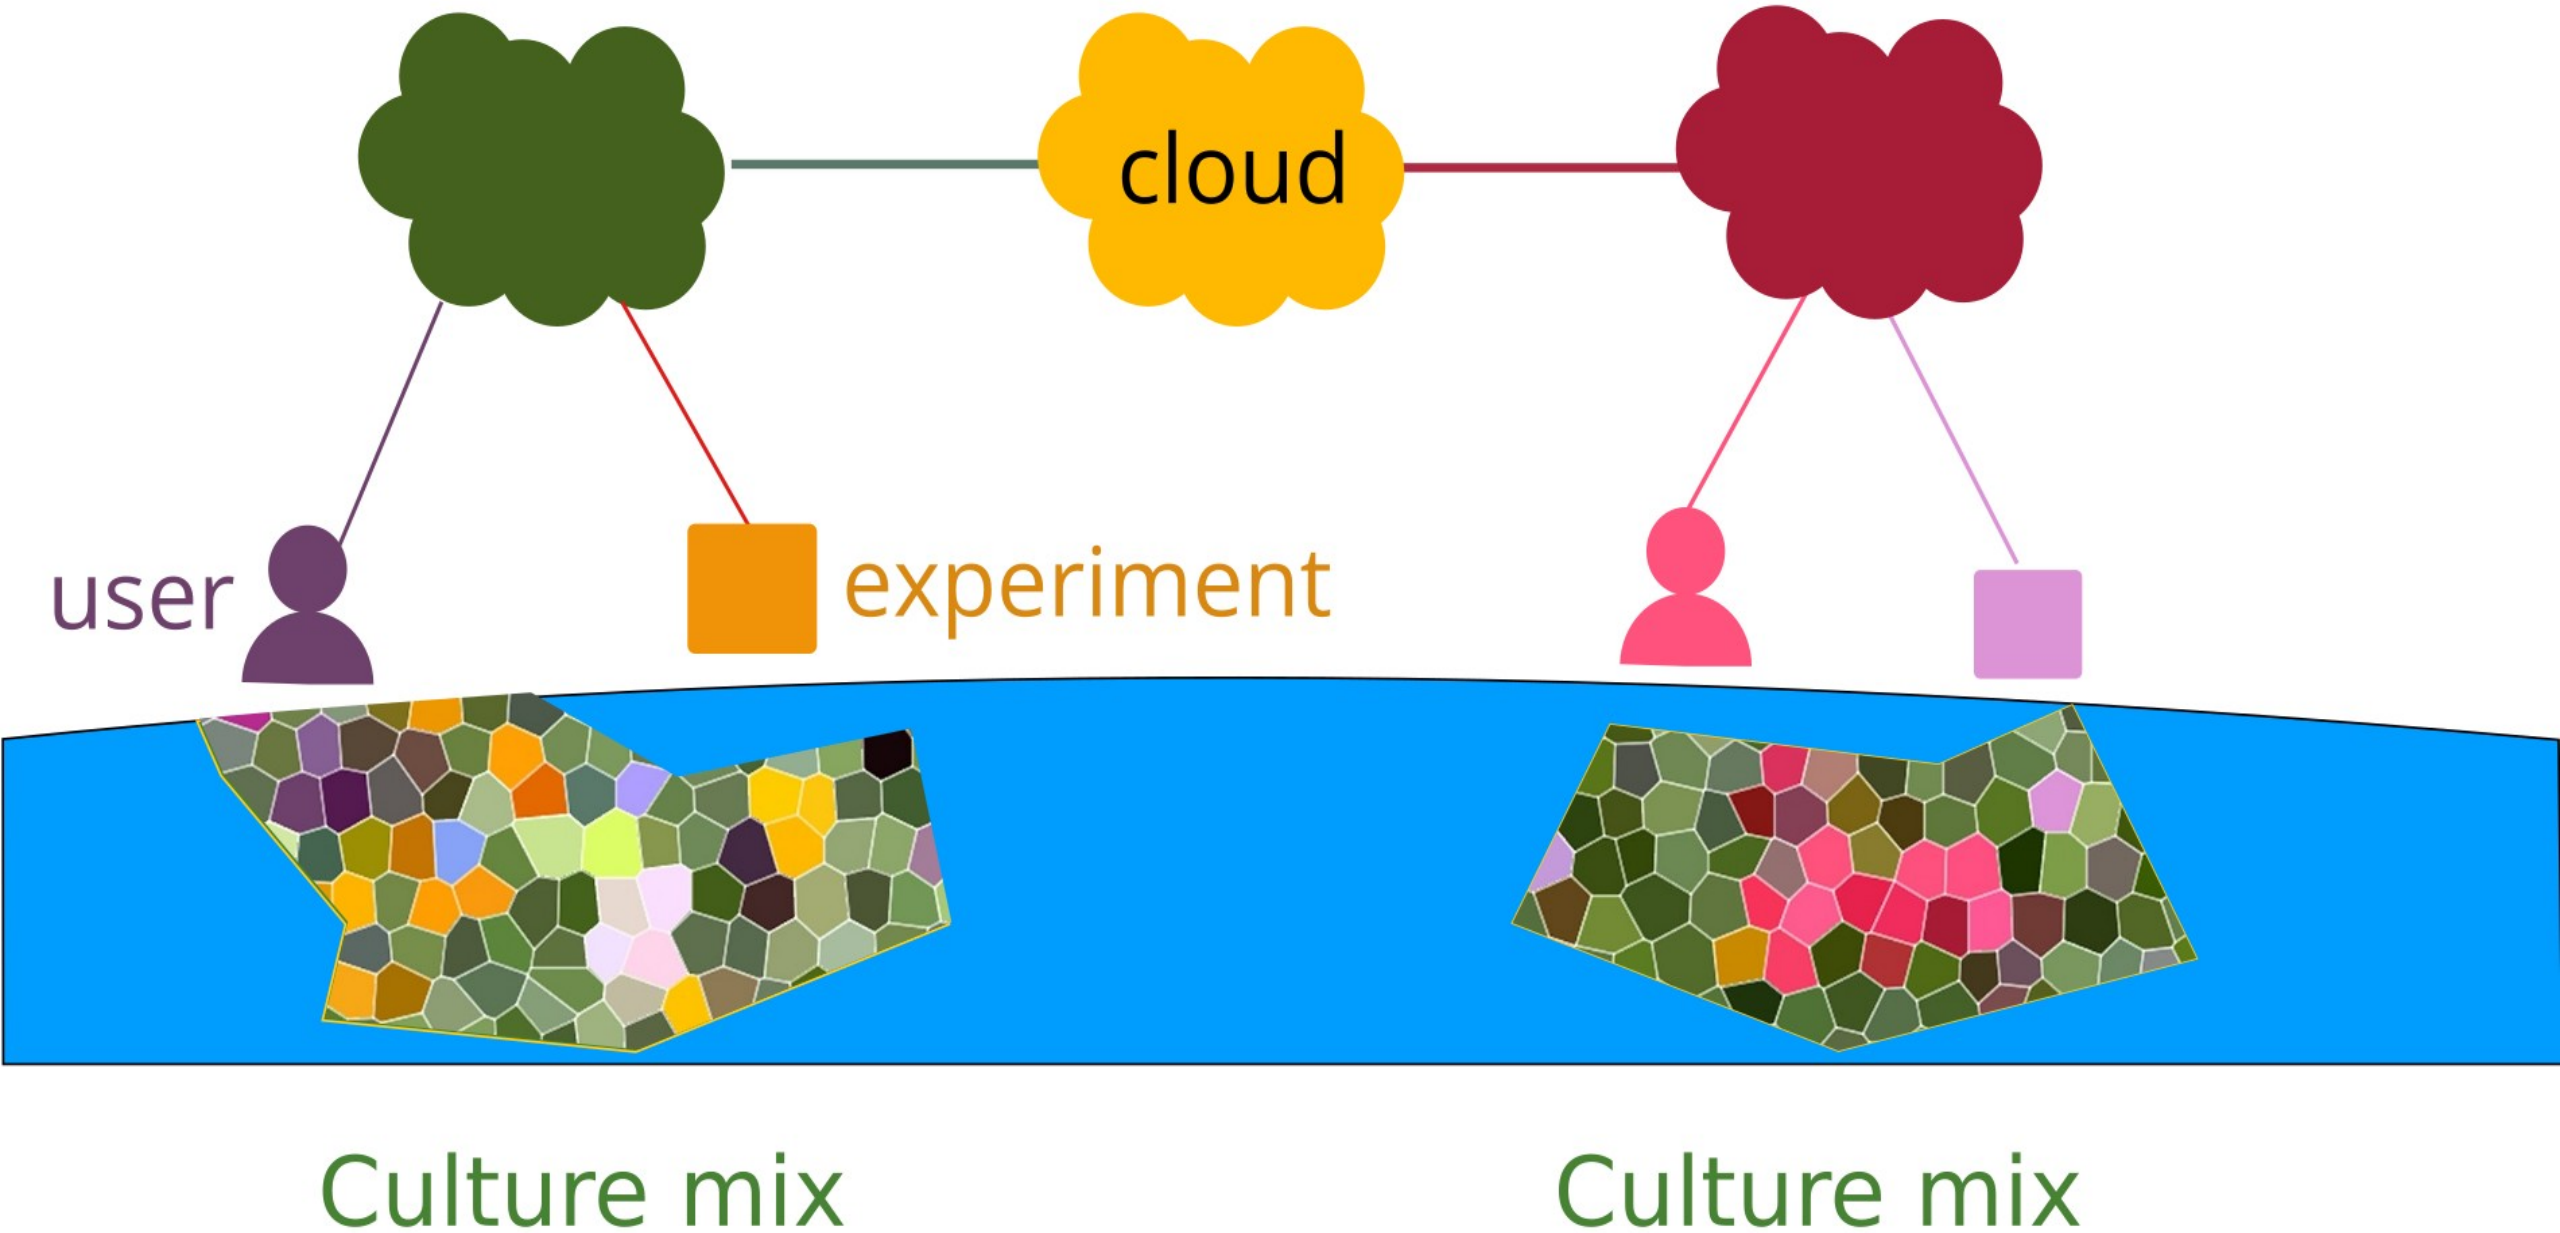

Part 2 → staff experience?

One size fits no-one (but a good start?)

Openly share & modify (respect values, locality)

(e) States should invest in free and public digital platforms and infrastructure for education, grant adequate funding to public institutions to develop alternative free digital solutions and tools that do not involve the private personal data market, and support the development of non-proprietary data tools, platforms and services that are based around values of openness, transparency and common stewardship (rather than individual ownership) of data. They should prioritize the production and use of content in the form of open educational resources and provide a professional, systematic and personal guiding service to individual users;

A/HRC/50/32: Impact of the digitalization of education on the right to education

Educational delivery

Co-develop pedagogy & technology

Create, deploy & manage experiments

Extend core system & documentation

Build developer & user communities

Federate between institutions

Educational research

Automated feedback

Authentic assessment

Speculative methods

Student co-creation

Benefits

Improve experience & outcomes

- for students, staff, and institution

Do social good at all levels

- local, national, and international

Call to action

Identify opportunities for adoption

Identify barriers to adoption

Let us know about both!
